

APPENDIX 2- PROTOTYPE FEEDBACK

After I had presented a prototype of my product, feedbacks were given by the client to improve the App's functionality.

Client: Currently the App does not have a function to remove a teacher. Consider a situation when a teacher leaves the school and is not more involved in the event management of the school, how will you remove that teacher? Also, it would be better if the teacher can only handle the event managing process. Adding and removing teachers can be done by an admin.

Me: Sure, I can add an admin login, where there will be different functionalities available to the admin on admin's home screen. Could you let me know what all functions do you expect the admin to have?

Client: Okay.... So, adding and removing teachers can be done by the admin. The admin will have all the events displayed on the home screen as well. The admin cannot add or delete an event, and neither can the admin approve or disapprove a student from the event. There will be only one admin. In this case, it will be me. And, if the existing admin leaves the school, include a function to remove that admin and add a new one.

Me: Okay. What I can do is, keep the home screen same for the admin like it was for the teacher. I'll remove the 'Add Teacher' button from the teacher's home screen and add it on the admin's home screen. Now, on the admin's home screen, there will be three buttons – 'Add Teacher', 'View Teachers', and 'View admin'. The 'Add teacher' button will follow the same function it used to with the same process, to add a teacher. The 'View Teachers' button will direct the admin to a screen where the list of registered teachers is displayed. On clicking a teacher from that list, the admin will be directed to another screen where the details of the teacher (entered by the teacher when signed-up) is available and a button 'Remove Teacher' is available at the bottom of this screen which will be used to remove a teacher in case he/she leaves the school. The 'View Admin' button would direct the admin to a screen where the current admin will be able to see his/her own details and a 'Remove' button will be provided at the bottom. On clicking this 'Remove' button, the admin will be directed to a screen where the admin can add another admin and the previous admin will be removed automatically once a new admin is added. Are these functionalities satisfying what you wanted?

Client: Yes, this will be good enough. Thank you very much.
